

SMART GLASSES

It is a high-tech device, very similar to a traditional pair of glasses, equipped with an intra-aural earpiece with integrated microphone for voice assistance (capable of translating into several different languages simultaneously). A 5 million pixel camera further enriches the equipment, making the streaming of the activities carried out in the crematorium fluid: the plant operator, wearing the SMART GLASSES, can in fact communicate directly with the GEM technical staff (who works on the PC company), allowing him to view the situation in real time and receive back the necessary support.
